

RQ4 Do the ecological associations survive a change of label source?

Keyword baseline   Qwen2.5-7B   Qwen2.5-72B   Llama-3.3-70B   credible interval spans 0

All 30 colour × PC effects per label source. MCMCglmm fixed effects, n = 1,174 species, 3 chains per model (MPSRF ≈ 1.0). Filled markers are significant at pMCMC < 0.05. Higher PCs carry much wider intervals, so the label-sensitive effects (WHITE × PC9, REDTYPE × PC7) are also the least precisely estimated.
